

Payload trajectory control progress

- Collected data from camera tracking a payload tethered beneath the drone
- Used the data to design an Extended Kalman Filter (EKF) for estimating the payload pose

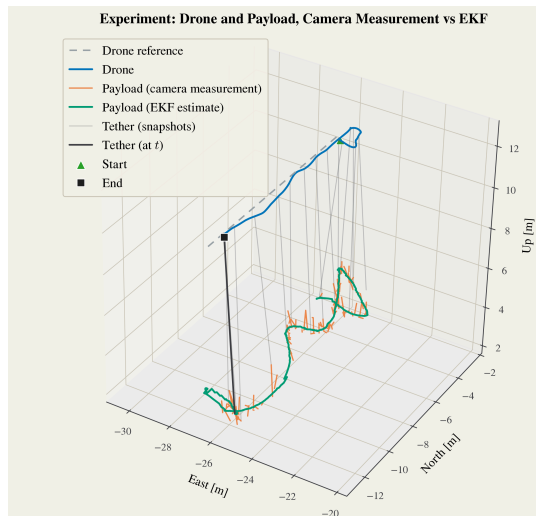

Figure 1: Drone tracking a trajectory with the payload as an unmodeled disturbance. EKF estimates are post-hoc; payload control is not yet closed-loop.

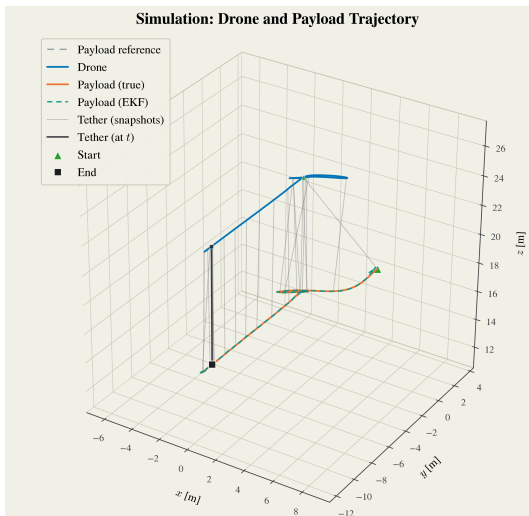

Figure 2: Simulation with EKF and payload control closed-loop: recovery from an initial perturbation, then trajectory tracking.
